My First Program using Flowgorithm

Flowcharts are pretty hard to do especially when you do not know if your flow chart is correct or not. Flowgorithm removed that problem by having features to warn you if the variables used in the program was incorrect. It also lets you test the program you created to check if the program works which is very convenient to me. At first, flowgorithm is really hard as I did not grasp yet the features of this application. Once I know the basic, creating the flowchart made things easier and more accurate. Though I do not fully master the program, knowing the basics of flowgorithm will make things easier.
