My First Half on PROGCON

      The PROGCON class is already on its half of the term. I think that in the PROGCON class we managed to accomplished a lot. The first one is learning to use flowgirithm which I think my skills in doing it has a lot of improvement in the past few days. I can already do a flowchart for circles which I first thought is already impossible to begin. I already know the symbols in a flowchart and how to use it. I can already formulate programs without using the internet which is great for me since it means that I already know how to use the program. There are still a lot of symbols that I still didn't know but I think for a very short period, my knowledge of flowgirithm is more than enough that I could wish for during that period.

    I also managed to learn using Github and Trello. I was able to learn their uses and manage to take advantage of their benefit for the class. In all honesty, my knowledge in using Github is not that much but still enough to use it accordingly to use it for submission. I know more about Trello because it is mostly used in every class. I think that Trello is so easy to use and everyone in the class is most likely using it because of its ability to connect and share our works.

    I also think that kahoot quizzes are one of the highlights of the class because it is fun and you can learn much more than an ordinary lecture. It makes you a bit competitive with your classmates and compares scores to each other. I am looking forward to every class on kahoot quizzes which is one of my motivations in coming to class on time.

    In conclusion, I think that we accomplished a lot of tasks in the class. It is fun and managed to meet my expectations for the PROGCON class.
